

After the descriptor exists

The map watches the money. It is not a seed. Plain text still shows the balance. On Tails, networking off:

1. Save the descriptor as map.txt. Do not write the public keys on paper.
2. Run: `gpg --symmetric map.txt`
3. Use a long passphrase. It is not on the plates. Write it on separate paper, away from the plates.
4. Keep map.txt.gpg. Delete map.txt. Store the encrypted file on two sticks.
5. Decrypt it once later and confirm it opens. If this passphrase is lost, the coins are not gone. Two plates can rebuild the map. The path is `m/48'/0'/0'/2'`. That path is not a secret.
